

Week 2 Report

Summary

In Week 2, we learned about version control and how to use GitHub. We created GitHub accounts and learned how to navigate through the website. We then installed the Git GUI and learned a bunch of commands that taught us how to clone a repository and load it onto our own computer so that we could work on it.

I learned a bunch of commands like `cd`, `ls`, and things like that, which allowed me to navigate through the terminal and perform the commands I needed to. After we finished working on the repository, we pushed our work and then waited for Ms. Amna to review it and merge it.

Overall, Week 2 was mainly focused on learning how version control works and understanding how GitHub can be used to manage and work on projects.

Tasks Completed

The tasks I completed during Week 2 were:

- I created a GitHub account.
- I learned how to navigate through GitHub.
- I installed the Git GUI.
- I learned a bunch of commands to navigate through the Git GUI and terminal.
- I cloned the repository.
- I worked on the repository.
- I pushed my work.
- I pulled updates from the repository.
- I waited for Ms. Amna to review and merge my work.

These tasks helped me understand the basic workflow of using GitHub and version control.

Skills Learned

One of the main skills I learned this week was a major understanding of version control. I learned how to use GitHub and how to work with repositories. I also learned how to work with the command prompt and understood the basic concepts and commands needed to navigate through the terminal.

I learned how commands such as `cd` and `ls` can be used to move through folders and view files. I also learned how to clone a repository, make changes, push those changes, and pull updates. This gave me a better understanding of how multiple people can work on the same project while keeping track of changes.

Challenges

One of the challenges I had during Week 2 was that I didn't have a computer at the beginning, so I had to get one. Once I got the computer, I immediately started working on the tasks.

Another challenge was that I didn't know how to navigate through GitHub or how to use the commands. I didn't know anything about GitHub or the commands when I started, so I had to learn all of it from scratch.

At first, the commands and the process of cloning, pushing, and pulling were confusing because I was not familiar with them. However, by practicing and following the steps, I was able to understand the basic process and complete the tasks.

Conclusion

Overall, Week 2 was a learning experience where I developed a basic understanding of version control, GitHub, and using the command prompt. Even though I started with very little knowledge about GitHub and Git commands, I was able to learn the basics from scratch and complete the required tasks. I now have a better understanding of how repositories work and how to use GitHub to manage and submit my work.
