

Week 3 Report

Summary

In Week 3, we learned how to develop an app for Android, specifically a simple application that did not require traditional coding. Instead, we focused on understanding the overall logic and implementation of the application.

Personally, I used the MIT App Inventor application creator, and I learned how to navigate through it and understand what everything did. I learned how to make something perform a specific function, how to use variables, and how to change things such as fonts and colors to make the application look and work the way I wanted it to.

I spent a couple of hours, at least six hours, navigating through MIT App Inventor and learning how everything worked. I also created an application at first just to practice and become familiar with the platform. After that, I worked on the actual assignment.

For the assignment, I looked through the Dribbble website to find something suitable for the task. I chose a design that I liked and then implemented it into my application. After finishing the implementation, I created the required document, added my reference, listed the tools I used, added an image of the application being run, and submitted it to the GitHub task file.

Tasks Completed

The tasks I completed during Week 3 were:

- Learned how to use MIT App Inventor.
- Created a starter application for practice.
- Created a second application for the actual assignment.
- Looked through Dribbble for design inspiration.
- Implemented the selected design into my application.
- Created the required documentation.
- Added my reference and the tools I used.
- Added an image of the application being run.
- Pushed the completed work into GitHub for Ms. Amna to review.

Skills Learned

The main skill I learned this week was a general understanding of application development. I learned how to use MIT App Inventor and how to create an application that performs functions a user might expect.

I also learned how to navigate through websites such as Dribbble and Figma to look for inspiration and ideas for application designs. I learned more about how an application is

planned and implemented and what it takes to create something that a user can interact with.

Another thing I learned was how working on an application can relate to working within a team or a business. I had to follow the requirements of the assignment, organize my work, document what I used, and submit everything through GitHub for review.

Challenges

One of the main challenges I faced was that I didn't know how to get things running at first. I would have an idea in my mind, but I didn't always know how to actually implement the desired function.

I also didn't know how to set up a lot of the things I wanted to use. Since I was beginning from scratch, I had to research a lot to understand how to make my ideas work within MIT App Inventor.

At first, it was difficult to figure out how to turn an idea into an actual working application. However, by researching and experimenting with the application creator, I was able to understand how the different components worked and eventually implement what I wanted.

Conclusion

Overall, Week 3 gave me a basic understanding of application development and how to turn an idea into a working Android application. I learned how to use MIT App Inventor, work with different components and variables, customize the appearance of an application, and implement functions without traditional coding.

I also gained experience finding design inspiration, creating my own application, documenting my work, and submitting it through GitHub for review. Although I had to learn many things from scratch and research how to implement my ideas, I was able to complete the assignment and gain a better understanding of the application development process.
